Project Submission Sheet

Student Name: Efe Matthew Akpovwovwo, Adebonojo Adesayo Oluwatosin, Princewill Chukwuemeka Madugba

Student ID: x24221783, x24248487, x24297461

Programme: Data Analytics **Year:** September 2025

Module: Business Intelligence and Business Analytics

Lecturer: Sean Heeney

Submission Due Date: 24th of April 2026

Project Title: A Simple CRM and Dashboard Setup to Improve PulseFit Gym Performance

Word Count:

Academic Integrity Certificate Verification Code: P5N1KG3qAH, FPUgbUdfmo, SDQW1n6HbR

I hereby certify that the information contained in this (my submission) is information pertaining to research I conducted for this project. All information other than my own contribution will be fully referenced and listed in the relevant bibliography section at the rear of the project.

ALL internet material must be referenced in the references section. Students are encouraged to use the Harvard Referencing Standard supplied by the library. To use other author's written or electronic work is illegal (plagiarism) and may result in disciplinary action. Students may be required to undergo a viva (oral examination) if there is suspicion about the validity of their submitted work.

PLEASE READ THE FOLLOWING INSTRUCTIONS:

1. Please attach a completed copy of this sheet to each project (including multiple copies).
2. Projects should be submitted to your Programme Coordinator.
3. **You must ensure that you retain a HARD COPY of ALL projects**, both for your own reference and in case a project is lost or mislaid. It is not sufficient to keep a copy on computer. Please do not bind projects or place in covers unless specifically requested.
4. You must ensure that all projects are submitted to your Programme Coordinator on or before the required submission date. **Late submissions will incur penalties.**
5. All projects must be submitted and passed in order to successfully complete the year. **Any project/assignment not submitted will be marked as a fail.**
6. **Please check that you read AI and Academic Integrity Acknowledgement Supplements in this document**

Adebonojo Adesayo Oluwatosin	Business Intelligence and Business Analytics	24/04/2026
Princewill Chukwuemeka Madugba	Business Intelligence and Business Analytics	24/04/2026

This section is a supplement to the main assignment, to be used if AI was used in any capacity in the creation of your assignment; if you have queries about how to do this, please contact your lecturer. For an example of how to fill these sections out, please click [here](#).

AI Acknowledgment

This section acknowledges the AI tools that were utilized in the process of completing this assignment.

Tool Name	Brief Description	Link to tool
-----------	-------------------	--------------

ChatGPT	Project ideas and outline and to create a banner for advertisement purposes	https://chatgpt.com/

DESCRIPTION OF AI USAGE

This section provides a more detailed description of how the AI tools were used in the assignment. It includes information about the prompts given to the AI tool, the responses received, and how these responses were utilized or modified in the assignment. One table should be used for each tool used.

ChatGPT
This tool was used to seek out ideas and and outline for our given topic

Highlight project ideas for this course business intelligence and business analytics using the brief attached. Also, the tool was used to create an advertisement banner for the gym.

Below are project ideas that fit your CA2 brief (company in trouble *or* scaling; must implement Power BI/Tableau + Dynamics/Salesforce/HubSpot, create 3 dashboards, and demonstrate CRM workflows/features).

1) Struggling E-commerce & Delivery Brand (severe issues)

Problem: High refunds, late deliveries, poor repeat purchases, messy customer support.

Data capture points: Orders, payments, delivery scans, returns, support tickets, marketing campaigns, product catalog.

EVIDENCE OF AI USAGE

This section includes evidence of significant prompts and responses used or generated through the AI tool. It should provide a clear understanding of the extent to which the AI tool was used in the assignment. Evidence may be attached via screenshots or text.

ADDITIONAL EVIDENCE:

BIBA Sem2 2025 CA2 v2 Final.docx
Word document

Highlight project ideas for this course business intelligence and business analytics using the brief attached.

Thought for 9s

Below are project ideas that fit your CA2 brief (company in trouble or scaling; must implement Power BI/Tableau + Dynamics/Salesforce/HubSpot, create 3 dashboards, and demonstrate CRM workflows/features). [BIBA Sem2 2025 CA2 v2 Final.docx](#)

1) Struggling E-commerce & Delivery Brand (severe issues)

Problem: High refunds, late deliveries, poor repeat purchases, messy customer support.

Data capture points: Orders, payments, delivery scans, returns, support tickets, marketing campaigns, product catalog.

3 dashboards (examples):

- **Revenue & Margin Control:** GMV, net revenue, discounts, refund rate, contribution margin by category.
 - **Fulfilment Performance:** on-time %, late reasons, courier performance, warehouse SLA, return reasons heatmap.
 - **Customer Health:** cohort retention, repeat rate, CAC vs LTV proxy, NPS/CSAT trends.
- CRM workflows to demo: case/ticket management, automated customer follow-ups, abandoned cart campaign, complaint escalation rules.

2) Failing Private Clinic (severe issues)

Problem: Missed appointments, long wait time, unpaid bills, poor patient experience, no visibility on doctor utilisation.

Data capture points: Appointments, billing/invoices, payments, patient feedback, referrals, service types, doctor schedules.

3 dashboards:

- **Operations:** avg wait time, appointment no-show %, utilisation by doctor, bottleneck analysis.
 - **Finance:** outstanding invoices, payment lag, service profitability, insurer vs self-pay breakdown.
 - **Quality & Experience:** complaint themes, satisfaction trends, referral sources, repeat visit indicators.
- CRM workflows: patient onboarding pipeline, appointment reminders, follow-ups, "case" handling for complaints.

SPECIFICATION REPORT

1. Business Background, Struggles and Goals

PulseFit is a large-scale gym company located in Lagos, Nigeria, and it has numerous branches in some of the most strategic locations across the state. Each branch is ran by a small management team which consists of a Gym Manager, a sales and customer care team, instructors, and maintenance personnel. PulseFit offers a range of different membership and fitness services which include group workouts, coaches for personal training, and fitness dance classes. At the moment, PulseFit is heavily reliant on new individuals picking up interest in the gym through referrals to get new customers, and revenue is heavily reliant on current members renewing their monthly subscription. In the past year, PulseFit has started to struggle. The business is not failing because there is no demand for fitness in Lagos, rather, it is struggling because it is losing members too quickly, with regular members attending less often, and the business does not have a structured way to track and fix the underlying issues pushing them away. There is also very strong competition in Lagos, which means members who are fed up can easily switch gyms when they feel the experience is not worth it anymore.

The first identified major issue is early cancellations of gym memberships. Many members cancel their membership within the first one or two months of their subscription. This is very dangerous from a business perspective because it increases churn, reduces predictable income, and forces PulseFit to spend more on marketing just to replace lost members. Another issue is low engagement, even when members do not cancel immediately, many of them stop coming regularly, and when members stop attending, they are more likely to cancel subscriptions or lose the habit of using the gym. PulseFit is also losing potential customers during the sales journey. Many leads show interest, with some even booking tours or trials, but follow up is inconsistent, and many potential new customers are lost before they join. There are a lot of operational issues that contribute to the business struggles, which include complaints about equipment, cleanliness, overcrowding, and staff support, and these complaints are not recorded and tracked in a consistent way, making it difficult to see patterns, measure response time, or hold teams accountable for fixing problems quickly. Equipment repairs also take too long, which directly reduces satisfaction and can lower attendance. Payment failures and overdue payments are another area of leakage, as failed payments are not flagged early, causing the gym to lose revenue. PulseFit is also struggling with visibility in a very cutthroat market. When members cancel, there is little thought of how to win them back, and many never return as the experience moves on to other gyms. PulseFit, on the other hand, not only loses potential monthly revenue but also interest and trust in their local community, meaning cancellations hurt more. An objective of this project is to assist in the re-engagement process by mapping cancellations first and providing management with a targeted action plan for winning over inactive and lost members.

To address these challenges, this project proposes a combined CRM and business intelligence solution. The CRM solution will help PulseFit manage the full customer journey, from new leads to registered members, and it will ensure that follow-up is consistent through automated tasks and structured stages. It will also provide a clear complaints process so issues are logged, prioritised, escalated when needed, and resolved with visibility. Business intelligence dashboards will then convert these activities into clear performance views for management. The dashboards will show churn and attendance trends, highlight branches with higher risk, track conversion through the sales funnel, resolution times, equipment downtime, repeated issues, and detailed customer complaint reports. The goals of our solutions are practical and measurable, and it aims to reduce early cancellations by identifying members who are becoming inactive and engaging them before they leave. Secondly, it aims to increase attendance by tracking check-in trends and focusing on localities where engagement is falling. Thirdly, it aims to improve lead conversion by monitoring the sensitive steps from lead to tour to trial to membership by conducting proper and thorough follow-ups. Furthermore, It also aims to improve the

gym experience by tracking complaints properly, reducing equipment downtime, and speeding up resolution times. Most importantly, the project aims to provide management a simple and reliable way to see performance across the business monthly, through dashboards so decisions are based on evidence rather than guesswork.

SWOT/Gap Analysis

PulseFit Lagos is experiencing some operational inefficiencies that are affecting the satisfaction and retention of customers. There is an absence of structured systems for recording and properly tracking the complaints, which leads to inconsistent responses and unresolved issues. The trust of customers is reduced, which leads to an increase of the likelihood of cancellations. Maintenance processes are also reactive, with equipment issues being addressed after failure with no tracking of downtime or repeated faults, which leads to the increase of costs and reduced service quality.

A CRM-based complaint tracking system and Tableau dashboards were introduced to address these gaps. What was done in them was complaints are logged as structured cases, which enables monitoring of *TicketType*, *Severity*, and *ResolutionDays*. Maintenance activities are tracked using *DowntimeHours* and *RepeatIssueFlag*, which allows the identification of recurring issues. This shifts PulseFit from reactive operation to a data driven approach which improves the service quality and operational efficiency [1][2].

Requirement	Fit	Gap	Solution
Complaint tracking	Partial	No structured logging	Salesforce Case system
SLA monitoring	No	No resolution tracking	ResolutionDays + Tableau charts
Maintenance tracking	Partial	No downtime tracking	Maintenance dataset
Operational visibility	No	No dashboards	Tableau Ops dashboard
Decision-making	Partial	Based on assumptions	Data-driven reporting

Table 1. Fit analysis (operations)

These improvements are in alignment with data-driven service management approaches, where structured complaint tracking and maintenance analytics support better operational decision-making [1][3].

Sales and Marketing Problem Statement

PulseFit Lagos has a lot of presence in various localities around Lagos, Nigeria, such as Ikeja, Lekki, Victoria Island, Eti Osa, Ikorodu, Amuwo Odofin and Sangotedo. Although the market in Lagos has been increasing in its fitness sector, PulseFit experiences a lot of challenges when it comes to changing the potential members into paying customers. Customer Relationship Management (CRM) systems are well known as important tools for managing customer interactions throughout the sales process and increasing conversion rates [4]. The gym receives leads through various channels such as Instagram, TikTok, Google, referrals, flyers and walk-ins, yet it does not have an organisation to track the leads, follow up on them and convert them into actual customers. The primary issues in the sales and marketing function as noted include slow or sluggish response times to new enquiries, high no-show rates during both tour and trial appointments, the inability to determine which of the marketing campaigns or sources of leads generates the highest conversion, and the lack of an automated mechanism to re-enrol the prospects that fall off the sales funnel. These types of loopholes cost a lot of revenue and marketing, and therefore a CRM-led sales process is needed in the growth of PulseFit.

Current State	Desired State
Informal tracking of leads through spreadsheets.	Salesforce CRM keeps track of every lead.
There is not an automated follow-up.	Key event-driven automated tasks.
No visibility on the performance of the campaign.	Conversion rate per campaign dashboard.
Systematic re-engagement of no-shows was not done.	Automatic re-engagement activities of no-shows.
No measured performance of Rep.	Conversion rate monitored per sales rep

Table 2. Sales and Marketing Gap Summary

2. System Analysis & Design

2.1 Data Capture & Analytics Requirements

Performance Overview Dashboard

PulseFit needs the right data for this project so it will be able to track and keep tabs on how each branch is performing and make decisions based on facts and not guesses. The Performance Overview Dashboard shows management a clear monthly picture of membership stability, revenue, and engagement. It focuses on finding early warning signs before cancellations start to rise. To do

this, the gym needs to keep monthly records of its members that show the member, the month, the location, whether the member cancelled, how many times they checked in, and if their payments are up to date.

The dashboard keeps track of four important metrics, it shows the churn rate, which is the number of people who cancelled their membership in a given period. It shows how much money was made each month based on the total fees paid. It shows the average number of check-ins each month to make it easy to see how many people are attending and participating. It also shows how many members are at risk, which means that they have not checked in for some time and may cancel soon if nothing is done. Churn rate is calculated by dividing the number of members who cancelled in a given month by the total number of members registered for that month. Members at risk are defined as those who checked in at most once or less during the month. This helps management figure out which areas are having trouble, whether attendance and revenue are going up or down, and where to focus their efforts to keep customers.

Sales & Marketing Dashboard

The Sales and Marketing Funnel can be listed as having the following analytics requirements:

Lead Volume by Stage: What are the volume of leads on each stage of the pipeline (New Lead, Contacted, TourBooked, TrialBooked, TrialCompleted, Joined, Lost)? This is the part where the funnel is leaking.

Conversion Rate by Lead Source: Which lead source (Instagram, TikTok, Google, Referral, Flyer, Walk-in) has the most users who signed up? This is a sign of how the marketing budget is being spent.

Conversion Rate by Campaign: Which campaign (ReferAFriend, NewYearRush, StudentOffer, SummerBody, PTBundlePush) gets the most sign-ups compared to the amount of leads it generates?

Tour No-Show Rate: How many leads that book a tour do not show up? The high rates of no-shows mean that the automation of reminders and re-engagement is required.

Trial No-Show Rate: How many of the leads that schedule a trial session do not turn up? The no-show trial leads are highly prone to loss.

Conversion rate by Sales Rep: Which rep is turning the highest percentage of leads into sales? This is good for making decisions about performance management and coaching.

Integrating with the Customers in the Process:

The Salesforce CRM system has a lot of ways for customers to be involved in the sales process. When someone who might want to join asks a question through any channel (social media, walk-in, referral, or flyer), Salesforce immediately creates a Lead record that includes their source, location, and campaign attribution. The system then guides the user through a series of steps, including making initial contact, booking a tour, having a trial session, and converting to a membership, with automated reminders and follow-up activities at each step. The system lets PulseFit know when a customer does not show up for an appointment and starts a re-engagement activity to make sure they do not lose touch with the company and stay with them. On the complaints side, when a current member complains, Salesforce creates a Case record that lets the client see how their complaint is progressing from New to Resolved. This would be a well organised technique to make sure that every time you talk to a customer, you record it, keep track of it, and take action about it.

Operations/Experience Dashboard

The Operations and Experience Dashboard requires structured data to be able to monitor complaints and maintenance performance across PulseFit branches.

For the complaints (*RecordType = Ticket*), the system must capture fields like *TicketType*, *Severity*, *ResolutionDays*, *PostResolutionRating*, *EventDate*, and *Locality*. These specific fields enable tracking of the volume of complaints, severity, distribution and service resolution performance.

For the maintenance (*RecordType = Maintenance*), the system must capture fields like *EquipmentType*, *DowntimeHours*, *MaintenanceCost*, *RepeatIssueFlag*, *EventDate*, and *Locality*. These specific fields support monitoring of equipment performance, downtime, and recurring faults.

The dashboard allows filtering by *Locality* and *EventDate* which enables branch-level and time-based analysis. To provide visibility was the goal when it comes to operational issues and support for faster resolution and preventive maintenance decisions. This supports data-driven monitoring of service performance and equipment reliability, which are key factors in the improvement of customer experience and operational efficiency [1][3].

2.2 Reporting Requirements

Dashboard 1 (Performance Overview Dashboard)

The Performance Overview dashboard must provide a single page summary that management can use to review the gym's performance quickly. It should be suitable for monthly performance reviews, and it should highlight changes that require action. The report must be easy to read, consistent and focused on the metrics that show whether the business is healthy or declining.

The dashboard should contain four visual sections. It must display churn rate by locality to show where member cancellations are highest. It must display a monthly revenue trend so management can see whether income is improving or falling over time. It must display an attendance trend using average monthly check-ins to show changes in member engagement. It must also display a single KPI card showing the number of members at risk so teams can act early with retention follow-up. The report must include a locality

filter that applies to the whole dashboard so management can view one area at a time, and it should allow all localities to be viewed together for comparison. Titles, axis labels, and number formats must be clear so the dashboard can be understood without explanation.

Dashboard 2 (Sales and Marketing Funnel)

- Lead Funnel by Stage:** A horizontal bar chart of the number of leads in each stage of the pipeline. It is needed to determine bottlenecks and drop-off points in the funnel.
- Conversion Rate by Lead Source:** A vertical bar chart that indicates the conversion rate (%) per source of lead. It is needed to determine the most important channels of acquisition.
- Conversion Rate by Campaign:** A vertical bar chart that shows the conversion rate (%) for each campaign. It is needed for figuring out how well the marketing strategies are working.
- Tour No-Shows vs Trial Attendance:** A stacked bar chart comparing the tour no-show rates and did they attend their trial. It is necessary to know re-engagement opportunities.
- Conversion Rate by Sales Rep:** A horizontal bar chart showing the conversion rate (%) for each rep. This was important to manage performance.

Dashboard 3 (Operations and Experience)

The Operations and Experience dashboard provides a visual summary of complaints and maintenance performance which is clear for PulseFit. The dashboard highlights key operational metrics, including the volume of complaints, the resolution time, equipment downtime, and maintenance cost. It allows the management to quickly identify problem areas, like high severity of complaints or equipment with frequent breakdowns. Visualising these metrics helps to identify operational issues and supports proactive service management a lot faster [1]. Interactive filters such as Locality and Event enables users to focus on time periods, supporting targeted analysis and faster decision-making.

CRM Requirements

Below are the requirements for the Salesforce CRM Implementation:

Salesforce would have to handle the whole lead cycle, from the first inquiry to the conversion of membership or loss. The system should keep track of each lead's source, the name of the campaign, the name of the rep assigned to the campaign, the name of the locality, and the time of the first response. The results of tour and trial appointments, whether they attended or not, should be noted against every lead. All the leads that come out of the funnel and are not converted should be counted as lost. There should be a well organised way to handle complaints, where all the problems brought up by members are noted down until they are fixed, including the type of ticket, how serious it is, where it happened, and how long it took to fix it. Build up automatic workflows such that one does not have to do any follow-up work by hand, and no lead or complaint would go unnoticed.

3. Database Design (System Architecture + ERD + Data Dictionary)

Fig. 1. System Architecture

The system architecture shows how data moves through the PulseFit Lagos solution, which starts with capturing and ends with business decision-making.

Firstly, data comes in from customer interactions which can be leads from Instagram, walk-ins, and referrals, plus customer complaints (as tickets) and maintenance logs. Salesforce CRM records and manages all this information, using objects like Lead and Case to organise both customer and operational data. Automation flows inside Salesforce help manage each process.

Once structured, CRM data sits alongside other internal and external datasets. These include operational data saved as CSV files *CRM_Ops_LAGOS.csv* and external competition data in *Competition_Summary_LAGOS.csv*. Within this storage layer, Salesforce objects *Lead* and *Case* remain the main source for structured data.

All this combined data then goes to Tableau for processing. Here, the system filters data (for example, using *RecordType*), aggregates numbers with *SUM*, *AVG*, and *COUNT*, and cleans the data. To merge external competition data with the internal information, everything is linked by the Locality field, making it possible to analyse everything together.

After processing, data appears in three dashboards: Performance (showing member activity and churn), Sales (covering lead conversion and pipeline), and Operations (reporting on complaints and maintenance). These dashboards give interactive views into critical business areas.

The insights from these dashboards drive business decisions and actions. Managers and leaders may use what they learn to boost efficiency, improve customer experience, and steer strategic planning.

Technology Justification

We picked the tools used for this project by putting focus on what would actually solve PulseFit's actual business problems, not just what sounded good on paper. The system needed to handle customer interactions well and provide straightforward insights for smarter decisions. That is why we went with Salesforce CRM and Tableau Public as the backbone.

Salesforce CRM Justification

Salesforce was our choice for managing customer relationships because it gives PulseFit a clear, organised way to handle customer data from the first registration all the way through to membership and resolving complaints.

Before this, PulseFit did not have any real system for tracking leads or complaints. Opportunities slipped through the cracks, and customer problems sometimes just lingered without being fixed. Salesforce tackles these issues by introducing standard objects like Lead and Case, so every customer interaction gets logged and tracked the same way.

Another reason for the use of Salesforce is automation, with the use of flows, we can stop relying on people to remember every follow-up. For instance, a new lead triggers a follow-up task automatically. If a lead misses a tour, the system re-engages them without the need to chase the customers down. What this deals with head-on are the slow responses and lost leads that were prevalent before.

Salesforce also lets us store highly structured data, which is critical for analytics. We added custom fields such as *FirstResponseTimeMins*, *TourNoShowFlag*, *ResolutionDays* in order to collect key business metrics. These are not just for recordkeeping; they turn the CRM into a real tool for data-driven analysis.

In short, Salesforce takes what was an informal and patchy process and turns it into an organised, hands-off system that boosts both sales and services.

Tableau Justification

We went with Tableau Public for business intelligence because it turns raw data into clear, interactive dashboards. Dashboards that managers can actually use to make decisions.

It was not just about gathering data for PulseFit but also making sense of it. Tableau lets us pull together multiple datasets and visualise them in ways that make trends pop out. In this project, we combined internal data from member activity, CRM records, and operations, along with outside competition data.

What really sets Tableau apart is the ability to create calculated fields and do aggregations such as *SUM*, *AVG*, *COUNT* all come in handy inside the dashboards. This made it straightforward to track things like churn rate, conversion rate, and average resolution time without leaving the platform.

Tableau dashboards are also interactive. Filters like *Locality* and *EventDate* help managers zero in on specific branches, see trends over time, and dig as deep as they need. That way, they are not just guessing where the problems are, but they can actually see them and respond.

Overall, dashboards in Tableau give management a clear view of sales, performance, and daily operations, which will help to steer them towards decisions based on evidence and not hunches.

Integrated System Justification

Putting Salesforce and Tableau together creates a complete, end-to-end solution. Salesforce takes care of capturing data and managing every process, making sure every customer interaction, complaint, and operational activity gets recorded properly, while Tableau takes that data (plus external datasets) and turns it into real insights and visuals that are clear. The two systems mesh by sharing fields like *Locality* and *MemberID*, making it possible to connect internal and external data. That way, we can compare how PulseFit is doing internally to what is happening in the market and the broader competitive landscape. This combination means PulseFit does not just collect data, but they put it to work. It leads to better decisions, streamlines operations, and sets up a solid foundation for whatever is next.

Full ERD and data dictionary

The Entity Relationship Diagram (ERD) simply represents how the data is structured and connected across the PulseFit system. The model integrates member activity, CRM data, operational records, and external data. The Member entity connects to *MemberMonthly*, which tracks attendance, payments, and cancellations over time. It also connects to the Case (Ticket) system, which is where complaints are recorded, creating a one-to-many relationship. The Case entity holds complaint specifics like *TicketType*, *Severity*, *ResolutionDays*, and *Status*. The Maintenance entity captures equipment performance data, including *DowntimeHours*, *MaintenanceCost*, and *RepeatIssueFlag*, and is linked to Equipment via *EquipmentID*. The Lead entity functions as a stand-in for prospective clients. It connects to both *Campaign* and *AssignedRep*, establishing a one-to-many relationship with each of them. All entities are connected through the Locality field, which links internal datasets with the *CompetitionSummary* dataset for integrated analysis.

Fig. 2. ERD
The following tables below are the data dictionaries for *Member*, *MemberMonthly*, *Lead*, *Case (Ticket)*, *Maintenance*, *Equipment*, *Campaign*, and *CompetitionSummary*.

Table Name	Field Name	Data Type	Description
Member	MemberID	Text	Unique member identifier
Member	Locality	Text	Location of member

Table 3. Member

Table Name	Field Name	Data Type	Description
MemberMonthly	MemberID	Text	Unique identifier for each member
MemberMonthly	Month	Date	Month of record
MemberMonthly	Locality	Text	Gym location
MemberMonthly	CancelFlag	Boolean	Indicates if member cancelled
MemberMonthly	MonthlyFee	Number	Fee paid by member
MemberMonthly	CheckInsThisMonth	Number	Number of visits in the month

Table 4. MemberMonthly

Table Name	Field Name	Data Type	Description
Lead	LeadID	Text	Unique lead identifier
Lead	LeadSource	Text	Source of lead
Lead	CampaignName	Text	Marketing campaign name
Lead	AssignedRep	Text	Sales representative
Lead	FirstResponseTimeMins	Number	Time taken to respond
Lead	LeadStage	Text	Stage in sales funnel
Lead	TourNoShowFlag	Boolean	Indicates missed tour
Lead	TrialNoShowFlag	Boolean	Indicates missed trial
Lead	ConvertedToMemberFlag	Boolean	Indicates conversion
Lead	LostReason	Text	Reason for lost lead
Lead	EventDate	Date	Event date
Lead	Locality	Text	Location
Lead	LeadCreatedDate	Date	Date lead was created

Table 5. Lead

Table Name	Field Name	Data Type	Description
Case	CaseID / TicketID	Text	Unique complaint identifier
Case	TicketType	Text	Type of complaint
Case	Severity	Text	Priority level
Case	Locality	Text	Location of issue
Case	ResolutionDays	Number	Days to resolve complaint
Case	Status	Text	Complaint status
Case	MemberID	Text	Linked member

Table 6. Case (Ticket)

Table Name	Field Name	Data Type	Description
Maintenance	MaintenanceID	Text	Unique maintenance record
Maintenance	EquipmentID	Text	Equipment identifier
Maintenance	EquipmentType	Text	Type of equipment
Maintenance	DowntimeHours	Number	Hours equipment unavailable
Maintenance	MaintenanceCost	Number	Cost of maintenance
Maintenance	RepeatIssueFlag	Boolean	Indicates repeated issue
Maintenance	Supplier	Text	Service provider
Maintenance	EventDate	Date	Maintenance date
Maintenance	Locality	Text	Location

CompetitionSummary	AvgTrafficScore	Number	Traffic score

Table 10. CompetitionSummary

4. Mock Data, Data Structures & Preprocessing

Member Monthly Mock Dataset

The *Member Monthly* dataset is a made up dataset that was created using Mockaroo. The goal of this dataset is to see how the gym would be monitoring members' activity and payment. It is organised monthly, as each row is an activity of each individual member during a given month. The data consists of a member ID, the month of the record and the branch each member uses. It also covers areas which would enable PulseFit to monitor significant membership outcomes such as cancelled subscriptions within the month and engagement indicators such as check-ins within the month. This dataset was created to support the Performance Overview dashboard and to make it possible to analyse churn, revenue trends, and attendance patterns across months and localities. *Monthly Fee* represents the fee amount linked to each member in that month, and it allows revenue to be aggregated by month for reporting. *Check-ins This Month* represent how often the member visited in that month and are used to measure engagement. A cancellation flag is included so churn rate can be calculated by month and compared across localities.

Competition Summary Dataset

The main dataset used in this project was the *Competition_Summary_LAGOS.csv* file. It gives a clear picture of the overall market for PulseFit Lagos. We started with the raw [Sports and Fitness sample data.csv](#) file, cleaned it in Excel, got rid of all the noise, added some calculated fields, and organised everything so we could really see what the gym competition looks like in different neighbourhoods. The final dataset spells out things like the number of competitors in each area, their average ratings, total review counts, and average traffic score. We relied a lot on Pivot Tables and functions like *SUM*, *COUNT*, and *AVERAGE* to pull these details together. There was a good amount of cleanup behind the scenes, to ensure data types fit, fixing missing values, and putting dates and categories into the right format so that it all lines up correctly for analysis. Next, we matched this competition data with PulseFit's internal numbers using the *Locality* field. That lets us compare what is happening inside PulseFit, such as member churn, customer complaints, and daily operations, in order to know what is happening in the larger market. So if a certain neighbourhood has a lot of rival gyms or gets better reviews, we can see exactly how PulseFit is doing in that exact spot. By combining these data sources, PulseFit finally gets a real sense of how external competition is affecting its own performance. It is much easier to spot which neighbourhoods need more effort or new strategies. Honestly, the process of turning messy data into useful, summarised insights is just standard practice in business intelligence. Bringing together external market data with a company's statistics is not just a PulseFit strategy but a strategy done in several companies. When you combine different sources, you get a better and more useful picture of what is really going on.

CRM/Ops Mock Dataset

The CRM/Ops mock dataset, *PulseFit_CRM_Ops_LAGOS.csv* was created with the use of Mockaroo to give the simulated version of the operational data that PulseFit Lagos would be producing with the help of their CRM and facilities management systems. The data was created to simulate a real life gym business in Lagos with local branch names, sources of lead in the Nigerian market and

appropriate categories of complaints and maintenance. The data set consists of 1,000 records which are organised into three types of records, organised using one field *RecordType* to distinguish between them.

Lead records: A lead record symbolises a potential member who passes through the sales funnel. The most important ones are *LeadStage*, *LeadSource*, *CampaignName*, *AssignedRep*, *FirstResponseTimeMins*, *TourNoShowFlag*, *TrialNoShowFlag*, *ConvertedToMemberFlag*, *LostReason*, *EventDate* and *Locality*.

Ticket records: Members' complaints and service problems. Some important fields are *Tickettype*, *Severity*, *ResolutionDays*, *ResolvedFlag* and *PostResolution* Rating.

Maintenance records: Reflecting the maintenance operations on equipment. Major ones are *Equipmenttype*, *Downtimehours*, *maintenance cost*, *Repeatissue flag* and *Supplier*.

There was very little preprocessing to be done with the dataset because it was in an organised format. The sole preprocessing involved a data source filter in Tableau Public to isolate *RecordType* = *Lead* to analyse for Dashboard 2, and the analysis used 319 Lead records. It is important to mention that this dataset was utilised only in Tableau Public to analyse Dashboard 2. It was not imported into Salesforce. The Salesforce CRM was set up and shown with sample records that are manually entered and created to show that the system is completely functioning and able to receive real PulseFit data.

WHO DID WHAT (SPECIFICATION REPORT)

PRINCEWILL'S CONTRIBUTION

I was responsible for defining the operational requirements of the system, which focused on the complaint handling and equipment maintenance. I developed the SWOT/Gap Analysis to identify key operational weaknesses, which includes the lack of structured complaint tracking and a reactive maintenance process. I created the Fit-Gap analysis to map business needs such as SLA monitoring, downtime tracking, and operational visibility to the proposed CRM and Tableau solutions. I specified the data and analytics requirements for the Operations and Experience dashboard, identifying the key fields (e.g. *TicketType*, *Severity*, *ResolutionDays*, *DowntimeHours*, *RepeatIssueFlag*) and defining how they should be used to support analysis. I also contributed to the system design by writing the System Architecture section and the Technology Justification, which explains how and why we used Salesforce and Tableau for our decision making process.

SAYO'S CONTRIBUTION

I wrote the sales and marketing problem statement that explained the issues with lead conversion and the differences between the informal processes currently in place at PulseFit and the targeted state of CRM. I formulated the sales and marketing analytics needs, such as KPIs used to analyse lead funnel, conversion rate per source and campaign, no-show rate and sales rep performance. I also wrote the customer integration section detailing how Salesforce interacts with the prospects at all points from the initial inquiry up to the conversion into a member. I defined Dashboard 2 visual requirements explaining the purpose and business value of each of the five charts. I also wrote clear CRM specifications of what Salesforce will need to achieve and automate in order to support the sales and marketing activity. Then lastly, I defined the CRM/Ops mock dataset format, such as Lead, Ticket and Maintenance record types, and ensured that the data were generated with Mockaroo.

EFE'S CONTRIBUTION

I wrote the business background and explained why PulseFit is struggling across all its branches in Lagos, with our main focus being to reduce cancellations by members, improve overall gym attendance, and stabilise revenue. Furthermore, I wrote the analytics requirements for the Performance Overview dashboard, including what data needs to be captured and the importance of the dashboard to management. In addition, I described the Member Monthly mock dataset, explaining its structure, key fields, and how it helps to identify churn, keep track of revenue, and make attendance analysis feasible. Finally, I helped to confirm the member related entities and the key fields used in the member dataset for the database design.

IMPLEMENTATION REPORT

1. Development Process

Performance Overview Dashboard Development Process

We built the Performance Overview dashboard after we agreed on the main PulseFit problems and what management needs to monitor. We started by checking that the Member Monthly dataset had the basics we needed, including locality, monthly check-ins, cancellations, and the monthly fee values. Once the data was connected in Tableau, we created the main measures we planned to report, especially churn rate and an at-risk indicator, so the dashboard could highlight member loss and early disengagement. As we worked with the data, we made a few practical changes to keep things consistent and easier to interpret. We kept the dashboard focused on Lagos localities so the datasets would link properly, and we used average monthly check-ins to reflect normal attendance patterns without overstating activity. After that, we created four worksheets and brought them together into one dashboard. The views cover churn by locality, revenue over time, and attendance over time, and there is also a simple KPI card that shows how many members are currently flagged as at risk. To make the dashboard easier to use, we added a locality filter across the whole view so management can focus on one area or compare branches across Lagos.

Salesforce & Dashboard 2 Development Process

The first step in implementing Salesforce CRM was to come up with a plan. This involved figuring out the primary business problems, such as the fact that the lead tracking system and follow-up process were not structured and that it was hard to monitor the performance of the campaigns and reps. The initial step was to construct a simple sales funnel, custom lead fields, and one automation flow. During the implementation of the project, various factors were introduced, which were not initially planned:

The complaints pipeline (Case object) was also introduced when the issue of member service was realised to be as significant as the lead tracking to a gym operation. After the feedback showed that the dashboard required more specific complaint data, four custom fields on the Case object (*TicketType*, *Severity*, *Locality*, *ResolutionDays*) were added. Two more automation flows (No-Show Follow-Up and Equipment Escalation) were introduced to further emphasise the automation evidence on top of the first single flow. The Salesforce CRM Dashboard was also included as a supplementary deliverable following the realisation that a graphic illustration of the case information was required to prove the reporting aspect of the system. Tableau conversion rate charts were originally constructed as raw counts but converted to actual percentage rates with the help of a calculated field after a review of analysis found this more analytically precise. Tableau Dashboard 2 was created once Salesforce was configured, and it used the CRM/Ops mock dataset that was filtered to Lead records only. The Dashboard went through a single revision cycle where chart types and measures were optimised to better support the business questions that were being answered.

Ops Dashboard build steps

The Operations and Experience dashboard was implemented in Tableau public with the *PulseFit_CRM_Ops_Lagos.csv* dataset being used. The *RecordType* field was key to the separation of Ticket and Maintenance data. Filters were applied at the worksheet level to make sure complaints analysis used *RecordType = Ticket* and maintenance analysis used *RecordType = Maintenance*.

Several worksheets were created for each analysis:

Complaints: It was *TicketType* vs *COUNT* of *TicketID*, which was coloured by *Severity*.

SLA: It was the Average *ResolutionDays* by *TicketType*.

Trend: It was *COUNT* of *TicketID* over *EventDate* (Monthly).

Maintenance: It was *DowntimeHours* by *EquipmentType*.

Cost: It was *MaintenanceCost* by Supplier.

Aggregations such as *COUNT*, *SUM*, and *AVG* were applied; these aggregations are commonly used in business intelligence to properly summarise operational performance and support analytical decision-making [2]. Null values were removed to make sure that the visuals were clean. The final dashboard had its structure with complaints on the left and maintenance on the right, with shared filters for *Locality* and *EventDate* to support interactive analysis.

2. CRM Implementation Evidence

Full Salesforce Implementation

A. Salesforce Objects & Access Controls

Here are the standard and custom Salesforce objects that were used in this project:

Lead Object - This is to receive all the prospective members who have initially enquired and followed through to conversion or loss. The Sales and Marketing Funnel Lead object is the main object.

Case Object - This is used to capture and manage complaints and service issues of the members. The complaints pipeline is supported by the Case object.

Opportunity Object - This object is used to indicate the stages of the pipeline of membership sales. Opportunities were set up with tailored phases that aligned with PulseFit sales process.

Task Object - It was used by all three automated flows to generate follow-up and escalation tasks of sales reps and managers.

Every object was set up to the default Salesforce Developer Edition profile, and field-level security was configured to be visible to all profiles of custom fields to make the data required by the sales and service departments accessible to them.

Fig. 3. Salesforce Object Manager Showing Lead Object

B. Membership Sales Pipeline (Opportunity Stages)

The Opportunity pipeline for Salesforce was set to reflect the entire membership sales process at PulseFit Lagos through an eight stage delivery pipeline. The stages have a percentage of probability of the likelihood of conversion at that stage of the funnel. Five sample Opportunity records were made to show how the pipeline works, with prospects at different stages in the sales funnel to make it look real.

C. Complaints Pipeline (Case Status)

A six-status Case pipeline was also set up to handle both member complaints and service problems from when they are received to the time they are resolved. The gap between Resolved and Closed was not accidental. Resolved means that the issue is fixed, whereas Closed means that this case has been administratively closed and signed.

STATUS	MEANING
New	Complaint just submitted

In Progress	Rep is actively working on it
Waiting on Customer	Pending customer response
Escalated	Escalated to senior management
Resolved	Issue fixed
Closed	Case administratively closed

Fig. 6. Salesforce Case Status Picklist Values

D. Custom Fields - Lead Object

On the Salesforce Lead object, eight custom fields were developed to store Salesforce PulseFit specific sales and marketing data. These fields were intended to directly fulfil the analytics needs identified in the Specification Report, and to be in the field structure of the CRM/Ops mock data set. The table below shows the custom fields that were created on the Lead object.

Field Label	API Name	Data Type	Purpose
Campaign Name	Campaign_Name__c	Text	Keeps track of which campaign brought in the lead
First Response Time Mins	First_Response_Time_Mins__c	Number	Tracks how quickly the rep responded to the enquiry
Tour No-Show Flag	Tour_No_Show_Flag__c	Checkbox	Keeps track of whether the lead misses their tour appointment
Trial No-Show Flag	Trial_No_Show_Flag__c	Checkbox	Keeps track of if the lead skipped their trial session
Converted To Member Flag	Converted_To_Member_Flag__c	Checkbox	Keeps track of whether the lead signed up for a paid membership
Lost Reason	Lost_Reason__c	Picklist	Keeps track of why the lead was lost
Event Date	Event_Date__c	Date	Keeps track of the date of the tour or trial appointment
Locality	Locality__c	Text	Keeps track of which Lagos branch the lead is linked to

Table. 12 Lead Fields List showing custom fields

E. Custom Fields - Case Object

There are four custom fields on the Salesforce Case object that were helpful in analysing complaints and making dashboard reports. These elements were added to the project after the initial setup because it became evident that the default Case fields were not enough to address the operational questions. The table below shows the custom fields that were created on the Case object.

Field Label	API Name	Data Type	Values
Ticket Type	Ticket_Type__c	Picklist	Equipment, Billing, Cleanliness, Overcrowding, Staff, Classes
Severity	Severity__c	Picklist	Low, Medium, High
Locality	Locality__c	Picklist	Ikeja, Lekki, Victoria Island, Eti Osa, Ikorodu, Amuwo Odofin, Sangotedo
Resolution Days	Resolution_Days__c	Number	Number of days taken to resolve the case

Table. 13 Case Fields List showing custom fields

F. Relationships, Layouts & Record Types

Relationships:

The main relationships between objects in this implementation are the following:

Lead to Task: Every automated flow creates a Task record that is linked to the initiating Lead record by the *WhoId* field. This way, follow-up tasks may be seen on the lead record's timeline.

Case to Task: The Equipment Escalation Flow establishes a Task with the case record that is connected to the triggering Case record, so that the escalation tasks can be seen on the case record.

Opportunity to Lead: Conversion leads are connected to the Opportunity record using the standard lead conversion feature of Salesforce and have a complete audit trail between original enquiry and membership.

Page Layouts:

Lead and Case fields were added to their respective page layouts to make them visible to everyone. The Lead layout was set up to show the sales-specific fields (*Campaign Name, First Response Time, No-Show Flags, Conversion Flag, and Lost Reason*) at the top of the record.

Record Types:

The standard Salesforce record types were used for this implementation. The Opportunity object is based on the use of the PulseFit Membership Sales process that was configured as a custom Sales Process with just the eight PulseFit-specific pipeline stages.

G. Automated Flows (Triggers & Workflows)

Salesforce also created three *record-triggered* flows, and they became active to automate critical sales and service processes. These flows are the triggers of the system, which automatically reacts to the change in record data without needing a human touch of the sales and service team.

Flow 1: Lead Assignment & Follow-Up Task

Trigger: A record is created

Action: The action will automatically generate a follow-up Task to the Lead Owner with a subject of Follow up with new lead and a due date.

Business purpose: Guarantees that all new enquiries are promptly followed up to eliminate the possibility of leads becoming cold as a result of being slow to respond.

Fig. 7. Flow 1 Diagram (Lead Assignment Flow)

Flow 2: No-Show Re-Engagement Task

Trigger: A record is created or updated

Action: Automatically creates a re-engagement Task for the assigned rep with the subject "No-show follow-up re-engage lead."

Business purpose: Business ensures that the no-show leads are not lost in the funnel with no intention of being re-engaged.

Fig. 8. Flow 2 Diagram (No-Show Follow-Up Flow)

Flow 3: Equipment Complaint Escalation.

Trigger: A record is created or updated

Action: Automatically gives the case owner an urgent escalation task with the subject line "Urgent equipment issue-escalate immediately."

Business purpose: Complaints about critical equipment are sent to management right away, which lowers the chances of long downtime that would affect the members' experiences.

H. Sample Case Records

To prove that the CRM is operational and can capture real-world PulseFit data, 6 sample complaint cases were created in Salesforce manually. All four custom fields of *Ticket Type*, *Severity*, *Locality* and *Resolution Days* were stored in each case to facilitate the Salesforce CRM Dashboard reporting.

Case Subject	Ticket Type	Severity	Locality	Status	Resolution Days
Treadmill broken at Ikeja branch	Equipment	High	Ikeja	New	3
Billing error on member account-Lekki	Billing	Medium	Lekki	In Progress	5
Air conditioning not working at Victoria island branch	Equipment	High	Victoria Island	Escalated	2

I. Salesforce CRM Dashboard

The PulseFit CRM Dashboard is a Salesforce dashboard that gives management a real-time view of how well all the Lagos branches are handling complaints. The dashboard was made using a report of cases held by the PulseFit team that is stored in a shared folder so that everyone may see live data.

The dashboard will include three elements:

Cases by Status (Bar Chart): It shows how the cases are spread out across the six pipeline states. At the time of implementation, there were 2 cases in New, 1 in Progress, 1 in Escalated, 1 in Waiting on Customer, and 1 in Resolved. This gives managers a real-time view of how many cases require attention at each pipeline stage.

Cases by Ticket Type (Horizontal Bar Chart): This chart shows which kind of complaints happen the most. The most common type of case is one involving equipment, which means there is an issue with maintenance that needs to be fixed.

Cases by Locality (Donut Chart): It shows how complaints are spread out throughout the branches in Lagos. There are currently two cases in each of Ikeja, Lekki, and Victoria Island, therefore, the cases are evenly spread around.

Fig. 13. PulseFit CRM Dashboard showing all 3 charts

3. Dashboards & Reports Evidence

Performance Overview Dashboard

The Performance Overview dashboard was created to give management a quick view of how the business is performing across Lagos. It brings together four views in one place so it is easy to see member cancellations, revenue movement, and member engagement without having to open multiple reports. The dashboard is interactive, so management can filter by locality and review one area at a time or keep all areas selected to compare performance across branches.

Fig. 14. Performance Overview Dashboard

The *Churn Rate by Locality* chart highlights which localities are losing the most members, making it easier to prioritise retention actions in the high risk areas. The *Total Revenue per Month* chart shows monthly revenue, calculated from the total monthly fees recorded in the dataset. This helps management see whether revenue is improving or declining over time and whether any months show unusual drops that may require investigation. The *Average Monthly Check-ins* chart shows average monthly check-ins by members, which act as a simple attendance indicator and help identify periods when member engagement drops. The *Number of Members at Risk* is a KPI card that displays the number of members at risk of cancelling based on very low check-in activity in the month. This is useful as an early warning signal, because low engagement often comes before cancellations.

In an attempt to make PulseFit regain active and cancelled members, we suggested a PulseFit Community Gym Tournament. It is a low cost and easy campaign that provides people with an actual reason to revisit the gym once more. It would be free and affordable to encourage more individuals to participate, and the winner would be given a cash prize and a 6-month gym membership. This simplifies outreach since PulseFit will be able to reach out to former members with something positive and exciting, rather than simply telling them to renew. It also assists in creating word of mouth and attracting new individuals to the gym through friends and community connection.

Fig. 15. Community Gym Tournament Banner

Dashboard 2: Sales & Marketing Funnel

Dashboard 2 was created using Lead records with only 319 rows of the CRM/Ops mock dataset. It gives five different views of the sales and marketing funnel of PulseFit, starting with first contact to membership conversion.

PulseFit Lagos — Sales & Marketing Funnel

Lead Funnel by Stage

Tour No-Shows vs Trial Attendance

False = attended their tour. True = missed their tour. Teal = attended their trial. Red = also missed their trial.

Conversion Rate by Campaign

Conversion Rate by Lead Source

Conversion Rate by Sales Rep

Fig. 16. Sales and Marketing Funnel Dashboard

The dashboard above has five charts. The **Lead Funnel by Stage** chart shows how many leads are at each stage of the pipeline. This helps management to figure out where the biggest drop-offs are happening and where to focus their sales efforts. The **Conversion Rate by Lead Source** chart shows the percentage of each lead source's conversion rate. This helps management to figure out which channels of acquisition bring in the best leads and distribute marketing funds. The **Conversion Rate by Campaign** chart shows which marketing efforts get the most people to sign up for memberships. This helps management decide which ones to run again or which ones to stop running. The **Tour No-Shows vs. Trial Attendance** chart shows that the leads are split between those who went on the tour and those who went on the trial. Red shows individuals who missed both appointments and need to be contacted right away, while teal shows those who missed their tour but went to their trial. Lastly, the **Conversion Rate by Sales Rep** chart will show how each rep is doing. This will help management find the reps who are doing well and train the ones who are not doing so well.

Dashboard 3

Fig. 17. Dashboard 3 (Operations & Experience) Evidence

The Operations and Experience dashboard offers crucial visibility into both complaints and maintenance performance. Within the complaints section, you will find *TicketType* and *Severity* data. This helps pinpoint the most common and pressing problems. *Average ResolutionDays* highlights service efficiency, while the *EventDate* trend shows the change of complaint volume over time. The maintenance section has its focus on *EquipmentType*, *DowntimeHours*, and *MaintenanceCost* to identify problematic equipment and high-cost areas. *RepeatIssueFlag* highlights the recurring faults, supporting preventive maintenance planning. The *Locality* and *EventDate* filters allow users to focus on particular branches and time periods, effectively turning the dashboard into a tool for active analysis.

4. Initial Impact & Expected Improvements

Performance Overview Dashboard

After implementing the Performance Overview dashboard, *PulseFit* now has a single and consistent way to monitor performance across Lagos. Management can quickly see which localities are experiencing a higher number of cancellations, whether revenue is trending up or down across the months, and whether member engagement is improving or declining based on check-in activity. This reduces guesswork and makes it easier to spot problems early. From an operational perspective, the main improvement is speed and focus. Instead of reacting after members have already cancelled, management can use the at risk indicator to identify members with low activity and trigger retention follow up sooner. The locality filter also makes it easier to compare branches and decide where to prioritise actions. Overall, the intended performance has been achieved because the dashboard provides a clear monthly view of business performance and supports earlier and more targeted decisions around retention and engagement.

Ops Impact

The implementation of the Operations and Experience dashboard has improved visibility and control over operational processes at *PulseFit*. The business gap related to the lack of complaint tracking has been partially closed. Complaints are now captured as structured Case records with measurable attributes like *Severity* and *ResolutionDays*, allowing consistent monitoring.

The operational process has been improved by the introduction of structured tracking and analysis of both complaints and maintenance activities. Instead of just relying on informal handling, issues are now recorded, categorised, and analysed using Tableau dashboards, improving accountability, and a response was prioritised. This is in alignment with research showing that structured complaint analysis and maintenance tracking improve service quality and operational responsiveness [1][3].

The intended performance has been partially achieved. While the system successfully provides visibility into complaint trends, resolutions performance, and equipment issues, measurable operational improvements like a reduced downtime or a faster resolution cannot be fully validated due to the use of simulated data. Overall, the system established a strong foundation for data-driven operations, with expected improvements in a real-world deployment.

Sales and Marketing Impact

The Salesforce CRM and Dashboard 2 implementation directly responds to all the 6 sales and marketing gaps in the Specification Report. The lack of a systematic lead tracking system has been addressed by the eight stage Opportunity pipeline that takes into account all prospects, starting with first enquiry all the way to conversion or loss. Flow 1 solves the problem of the absence of automated follow-up, as it will generate a follow-up task for each new lead. Flow 2 will also recognise no-show leads as re-engaged instead of being lost, and Flow 3 will also ensure that complaints regarding equipment are reported to the management immediately. Dashboard 2 closes the visibility gap on the analytics side by showing conversion rate views by campaign and sales rep, which lets management make informed decisions about the marketing and performance.

The sales process is no longer an informal and manual process but a structured and automated process driven by CRM. All new leads are now assigned an automatic follow-up assignment the same day, instead of a process in which the follow-up was solely left to the individual rep. No-show leads are automatically caught and re-engaged, as opposed to being silently lost out of the funnel in the past. Complaints on equipment are directly reported to the management, eliminating chances of extended downtimes that causes impact on the experience of the members. The management also can now view a live dashboard of status of complaints in all the Lagos branches, as compared to before, when there was no visibility of complaints.

The desired performance of the system has been achieved. The CRM has been configured, the three automations are activated, and the sales and marketing funnel dashboard provides the five analytical views that was specified. Further measurable improvements would be anticipated in three months in a live production environment. The first response time will be expected to decrease on average by more than 500 minutes to less than 60 minutes, since automatic task creation will eliminate delays experienced in manually following up the process. Automated re-engagement will decrease tour no-show rates by 20 to 30 percent. The conversion rates will also be better, with the sales team relying on the sales and marketing funnel dashboard insights to target the lead sources with the highest conversion rate and campaigns. The time of complaint resolution will also be minimised since the high severity cases will be automatically escalated instead of waiting to be reviewed manually.

5. Conclusions & Future Work

PulseFit had a lot of clear problems, members were cancelling too quickly, attendance was dropping, leads were not being followed up properly, and maintenance issues like complaints and equipment downtime were not being tracked in a consistent way. Management also did not have one reliable view of performance across branches, which made it harder to spot patterns early and

respond with the right actions. Our efforts aimed to bring about improvement in these areas by using Salesforce to manage customer activity and Tableau to report performance clearly.

Our offered solutions cater to different parts of the gym. The Performance Overview Dashboard gives management a simple monthly view of business performance across localities by tracking subscription cancellations, revenue trends, average check-ins, and an at risk indicator to highlight early warning signs. The Salesforce setup improves how PulseFit handles leads and complaints by using clear pipelines, custom fields, and automated follow up tasks so fewer prospects are ignored and important issues are escalated quickly. The sales funnel dashboard then shows where people drop off in the journey from lead to member and what factors influence sign-ups, such as response time, lead source, and potential customers not turning up. The Operations and Experience dashboard focuses on service quality by tracking complaint categories, severity, resolution time, satisfaction ratings, equipment downtime, repeated issues, and maintenance cost. Also, the fit gap and integration explain how the systems would connect and what the gym needs to do to keep data capture consistent. Overall, the solution reduces guesswork and improves control. Management can see which localities have higher cancellations, where engagement is falling, where leads are being lost, and which operational issues are affecting member experience. The expected improvement is earlier retention action, better lead conversion, faster complaint handling, reduced equipment downtime, and more stable revenue over time.

A very notable limitation is that our dashboards are built from monthly records, so they are best for monthly performance reviews rather than real time monitoring. In a real life scenario, PulseFit would get more value if the dashboards updated automatically through scheduled data updates. For example, the check-in and payment systems could export data daily or send it through an API into a central spreadsheet or database, and Salesforce case data could be pulled on the same schedule using Salesforce reports or the Salesforce API. Tableau would then connect to that updated source so the charts refresh during the week without anyone manually exporting and reloading files. Our setup would rely too much on staff using Salesforce consistently, because if lead stages, localities, or complaint details are entered inconsistently, the dashboard results and comparisons become less reliable over time.

Future improvements should build on the foundation we have already created by making the system smarter and more proactive. PulseFit can improve retention by setting up automatic follow-ups to track when a member stops showing up regularly, or they have a failed or pending payment, or they make a report on an issue experienced in the gym. With regard to sales, this can be improved by introducing lead scoring so the team knows which leads are most likely to join and can respond faster to high value prospects. On the operations side, PulseFit can reduce repeated equipment issues by keeping better equipment records and using preventive maintenance schedules instead of waiting for breakdowns. Over time, these changes would help the gym act earlier, reduce avoidable cancellations, and keep performance more stable across branches.

WHO DID WHAT

PRINCEWILL'S CONTRIBUTION

I implemented the Operations and Experience dashboard (Dashboard 3) in Tableau public using the PulseFit_CRM_Ops_LAGOS.csv dataset. I created multiple worksheets to analyse complaints and maintenance performance, which include the complaint volume by *TicketType* and *Severity*, average *ResolutionDays*, downtime by *EquipmentType*, and maintenance cost analysis. I applied *RecordType* filters to correctly separate Ticket and Maintenance data and used aggregations such as *COUNT*, *SUM*, and *AVG* to generate meaningful insights. I designed the dashboard layout with the left hand side having complaints and the right hand side having maintenance and added interactive filters, specifically *Locality* and *EventDate*, to support user-driven analysis.

SAYO'S CONTRIBUTION

I established the eight-stage Opportunity pipeline and six-status Case complaints pipeline in Salesforce and developed eight custom fields in the Lead object and four custom fields in the Case object in order to analyse the sales funnel and complaints. I established and enabled three automated record-triggered Flows of lead assignment, no-show re-engagement and equipment complaint escalation. I entered six sample case records where every custom field had been filled in Ikeja, Lekki and Victoria Island branches. I also created the Salesforce CRM Dashboard using three charts with cases by status, ticket type and locality and Tableau Dashboard 2 (sales and marketing funnel) with five charts based on the CRM/Ops dataset, with Lead records only. I wrote all the report parts of CRM and Dashboard 2.

EFE'S CONTRIBUTION

For the implementation report, I built the Performance Overview dashboard in Tableau and documented the full development process for that dashboard, from preparing the data to creating the final layout and filters. I wrote the dashboard and reports evidence section for the performance overview dashboard, explaining what each view shows and how management can use it. In addition, I completed the initial impact and expected improvements for the Performance Overview dashboard and wrote the conclusion section, including the limitations and future improvements.
